

A gargoyle is a carved or formed grotesque with a spout designed to convey water from a roof and away from the side of a building, thereby preventing rainwater from running down masonry walls and eroding the mortar between.

Gargoyle

1. Begin with covering the armature with a thin layer (1/4 inch) of clay
2. Once the armature is covered, begin sculpting the ogre.
3. The creature is "Bilaterally Symmetrical" (one side is the mirror of the other) therefore your best method is to sculpt both sides at the same time. Don't let one side get far ahead of the other.
